1 Introduction

On startup you should receive a message that tells you that you want the sos package.

If that isn't clear enough there is also a function provided called 'findPackage' that you can run at any time.

This is an example session using findPackage:

```
> library(findPackage)
> findPackage()

You want the sos package

> # That's right! It was sos!
> library(sos)
> #???"robust regression"
```
